

⇒ We're now interested in parameter calculation in a CNN architecture.

↓
two steps

I. First, determine the output shape
from input shape + layer info.

II. calculate parameters of a layer
↳ covered in
class lecture

[also look at the notebook
provided for tensorflow
implementation]

⇒ Things are a little different during counting
#param compared to normal convolution
on images.

↓

↓

in tensorflow,
you don't specify
value of P.

You define,

padding = valid/same

no padding

pad extra
layer

$$\frac{W-F+2P}{S} + 1$$

P = no. of padding

= 0/1/2/3/... ..

to keep i/p image size
fixed

wrong
interpretation

o/p size depends on stride

purpose of padding is to

avoid fraction \approx mismatch

shape \approx last layer?

\downarrow eqⁿ row

$$\frac{W-F+?}{S} + 1$$

\Rightarrow let's look at the examples.

1

$$i/p = (32, 32, 3)$$

$$\text{conv} \Rightarrow \text{filter} = (3, 3)$$

$$\# \text{ kernels} = 32$$

$$\text{padding} = \text{same}$$

$$\text{stride} = 1$$

(from :ipynb)

$$\downarrow$$
$$o/p = (32, 32, 32)$$

$$o/p = \frac{32 - 3 + ?}{1} + 1$$

$$= 30$$

$$? = 2$$

$$\hookrightarrow \frac{30 - 3 + 2}{1} + 1 = 32$$

2

everything as before, except stride = 2

$$\downarrow$$
$$o/p = (16, 16, 32)$$

$$o/p = \frac{32 - 3 + ?}{2} + 1$$

$$= \frac{29}{2} + 1$$

$$= 14.5 + 1$$

$$= 15.5$$

fraction size not possible

$$? = 1$$

$$= \frac{30}{2} + 1$$

$$= 16$$

⇓

obs-1 o/p size is not the same as
i/p in 'same' padding.

3

stride = 3

$$\begin{aligned} \text{o/p} &= \frac{32 - 3 + ?}{3} + 1 & \text{o/p} &= (11, 11, 32) \\ &= \frac{29}{3} + 1 & ? &= 1 \\ &= 9.67 + 1 & &= \frac{29 + 1}{3} + 1 \\ &= 10.67 & &= 10 + 1 \\ & & &= 11 \end{aligned}$$

4

filter = (4, 4)

stride = 2

$$\begin{aligned} \text{o/p} &= \frac{32 - 4 + ?}{2} + 1 & \text{o/p} &= (16, 16, 32) \\ &= \frac{28}{2} + 1 & ? &= 2 \end{aligned}$$

$$= 15$$

$$= \frac{32 - 4 + 2}{2} + 1$$

$$= 16$$

discussion
↓

here,

$$? = 2P$$

↑ 2 because we pad on both side

when, $2P = 2/4/\dots$ (even)

$$P = 1/2/\dots$$

we pad 1 layer.

but when, $2P = 1/3/\dots$ (odd)

$$P = 0.5$$

how to find the value?

meaning??

interpretation

- u pad only on one side/
- u pad on both side but ignore operation on the last portion

Solution

⇒ o/p size will be determined by the stride value.

↓

$s=2$, o/p size will be ip size/2

$s=3$, " " " " /3

$s=4$, " " " " /4

$$32 \xrightarrow{s=2} 16$$

$$32 \xrightarrow{s=3} 10.67 \approx 11$$

$$32 \xrightarrow{s=4} 8$$

irrespective of
the filter size

- add necessary padding to
match the o/p dimension

(calculate)

Valid padding

$P=0$ (no padding)

$$\Rightarrow \frac{32 - 7}{4} + 1$$

$$= \frac{25}{4} + 1$$

$$= 6.2 + 1$$

$$\approx 6 + 1$$

$$= 7$$
